CDD Vault to support Jubilant networked research to advance the collaborative experience with their customers

Jubilant Biosys and Collaborative Drug Discovery (CDD) have recently announced that, following an exhaustive evaluation, Jubilant has chosen CDD Vault as their discovery research informatics platform for the next 5 years.

Jubilant will be using CDD Vault as their informatics platform to facilitate and boost transparent distribution of research data and information. CDD Vault manages biological assay data, involved chemical structures, reactions and compound properties in a cohesive environment.

“CDD Vault will be used across Jubilant research sites; to keep experimental information centralized, both structured and unstructured, to share with clients.” said Marcel Velterop, President of Drug Discovery Services & CDMO at Jubilant Biosys Limited. “Scientists will be able to explore their chemistry and biology data in real-time, enabling rapid decision-making of discovery programs with CDD Vault”.

“Jubilant is a leading collaborator for pharmaceutical and biotechnology companies worldwide and we are delighted to assist them in sharing their high quality preclinical R&D services with the life science industry” said Dr. Mariana Vaschetto, General Manager, CDD Global Business. “CDD Vault has been designed for collaborative research within or between organizations in a secure and easy to use way. We are looking forward to this long term relationship with Jubilant and helping them ensure the success of their customers’ research.”
