

## Qure.ai's AI-driven chest X-Ray solution gets US FDA clearance for enhanced lung nodule detection

12 January 2024 | News

**This marks the 6th FDA clearance for Qure's chest X-ray based solutions**

Mumbai-based startup Qure.ai has announced its 13<sup>th</sup> US FDA clearance for its artificial intelligence (AI)-enabled solutions. Qure's chest X-ray based qXR-LN uses artificial intelligence to identify and localise lung nodules, marking another significant milestone for the organisation, strengthening its standing as a pioneer in the realm of AI-powered advancements for plain film radiography and medical imaging.

This also marks the 6<sup>th</sup> FDA clearance for Qure's chest X-ray based solutions. Notably, this is the only FDA-cleared solution for detecting and localising lung nodules utilising computer vision to have Radiologists, Pulmonologists and ER physicians as intended users.

The introduction of AI solutions, such as qXR-LN, presents a remarkable opportunity to cast a wider net to identify potentially malignant pulmonary nodules, thereby boosting the fight against lung cancer.

qXR for Lung Nodule (qXR – LN) is a cutting-edge computer-aided detection software designed to identify and highlight regions indicative of suspected pulmonary nodules ranging from 6 to 30 mm in size. Tailored for use in the incidental adult population, this innovative device is a game-changer in diagnostic technology. It can also serve as a crucial second reader for physicians, assisting in the review of frontal (AP/PA) chest radiographs of adults acquired on digital radiographic systems.
