

Clarius launches wireless ultrasound scanners

14 August 2017 | News

Clarius Ultrasound Scanners are developed as a visual stethoscope for clinicians and allow quick scans.

Canada-based healthcare technology firm Clarius Mobile Health has launched the latest Clarius App 3.1 Eclipse wireless handheld ultrasound scanner with advanced features and options.

Available on the App Store and Google Play, Clarius Ultrasound Scanners are developed as a visual stethoscope for clinicians and allow quick scans, as well as guide short procedures.

The Clarius C3 multipurpose ultrasound scanner can be used to image abdomen and lungs, and additionally includes a virtual phased array for quick scan of the heart, while the Clarius L7 is designed to guide procedures and image superficial structures.

The new Clarius Eclipse comes with increased capabilities for annotations to automatically monitor heart rate during cardiac scanning and for easy measurement of bladder volume.

Clarius Scanners are built with a magnesium case to withstand challenging environments and are made water submersible to allow easy cleaning and disinfection.
